

Gas Worldwide Reserves, Resources and Production

Yves Mathieu

IFP Rueil Malmaison, France

The presentation shows a general overview of reserves, resources, productions, constraints and scenarios for the future.

Firstly, reserves and resources definitions and their significances are well defined and discussed. Secondly reserves are presented per country and per capita and also for main geographical and economical areas. Thirdly the different factors affecting future production are listed and analyzed according to future reserves remaining to be discovered.

Finally, two possible worldwide production scenarios are presented, one without any constraints, the second taking into account the different current and future ones.

At least, conclusions show the main trends for gas exploration and production for the next decades.
