### **ABSTRACT**

The lack of good quality seismic data increases the structural uncertainty in the already complex structure of the Llanos foothills. Nevertheless, Equion has reported either a new reservoir or an extension of existing ones nearly every year since 2011. The strategy behind this success has been to approach uncertainty as an opportunity. The detailed study of available static and dynamic data to update the structural model and thus predict new reservoirs has allowed an increase in the gas and oil resources of the Pauto and Floreña fields.
