Fulfilment of the exciting potential for geothermal energy in Australia rests upon the geothermal industry and research community collaboratively solving the many technical challenges facing the sector. The Australian Geothermal Energy Group and its Technical Interest Groups facilitates the coordination and collaboration of research initiatives which are prioritised by industry, and implemented by collegiate national research groups including three dedicated geothermal research centres. This paper will provide an overview to the current research activities in Australia, discussing the priority research programs, synergies and areas of expertise of the key research groups working in the geothermal arena, as well as links to contacts and other information sources.
