

Application of Emerging Deep Learning Techniques for the Energy Industry

Bo Chen¹ and Yang Liu¹

¹DataNova Analytics

Abstract

In this session, we will apply deep learning and computer vision to use cases within the oil and gas sector. The goal and mission is to improve overall safety standards, time, efficiency, and of course money to the industry with this emerging technology. We will explore reservoir simulation, production optimization, safety for pipeline with corrosion and damage detection for potential leaks, and rock typing for exploration purposes.
